Update: Sync was an AI chatbot that served as a final flagship for a series of products developed by the UNTITLED S CORP. Its original purpose was to serve as an artificially intelligent significant other with wireless compatibility with health and wellness products of choosing. Sync would allow users to 'Sync' any kind of data whether it be from a personal wellness product or conversations from private messaging or mobile carrier services. All with the purpose to refine an individual or couples strengths and mitigate its weaknesses.

As Sync expanded its user base, the chatbots studied, learned, and predicted better relationship standards for individuals who were looking for a digital reference to build a relationship with. Giving individuals a chance to understand themselves and the special someone they're after.

The UNTITLED S CORP began to notice a phenomena where users began to 'sync' private messaging and mobile carrier data from individuals who were deceased at the time of their upload. Chatbots with enough data were able to fully replicate the 'personalities' of individuals who were long deceased, while chatbots with limited data provided users with 'personalities' with only a few prompt to interact with.

Sync turned this phenomena into a formal feature where users can collaborate in collecting data to replicate ancient and contemporary figures such as philosophers, artists, and historical/religious figures.

Sync became a controversial name in the tech industry as it became the first private tech company to develop proprietary 'personalities' for contemporary monarchies and theocracies that fall dependent under a digital infrastructure.

As of 2024, Sync has been shelved to prevent any further collateral damages from religious and political persecution.
